Colombian Giant Tarantula (*Megaphobema robustum*)

Vibrant New World Giants

Colombian giant tarantulas are a large species of beautiful and vibrant, new World tarantula indigenous to the tropical rainforests and forests of the Amazonian region of Northern South America. This species can be identified by its vibrant black and orange cephalothorax and limbs, and reddish-orange hairs on its abdomen. As with many tarantulas, this species can use its hind limbs to flick its loosely lodged hairs on its abdomen and limbs to serve as an irritant to many predators, and are known as urticating hairs. This species also performs several other unique defensive behaviors when threatened as well, including stretching out its limbs and bobbing, and quick and rapid spinning of their legs and joints. As with many species of New World tarantulas, the Colombian giant tarantula is a burrowing to terrestrial species that tends to be solitary and nocturnal. A rare and sought after species with a personality to match, the Colombian giant tarantula is a unique species to maintain for the more intermediate to advanced reptile or arachnid enthusiast.

Taxonomy

Life: All living, physical, and animate entities

Domain: Eukaryota

Kingdom: Animalia

Phylum: Arthropoda

Subphylum: Chelicerata

Class: Arachnida

Order: Araneae

Infraorder: Mygalomorphae

Family: Theraphosidae

Genus: *Megaphobema*

Species: *Megaphobema robustum**

**Taxonomy subject to change and revision.*

Lifespan and Longevity

Males of many tarantula species will often attain life spans of only 5 to 6 years. Females attain considerably longer life spans of 15 to 20 years or more in captivity.

Distribution and Habitat

<http://www.madisonherps.org>

The Colombian giant tarantula is a relatively large species of terrestrial to semi-fossorial New World tarantula indigenous to a fairly broad range of northern South America. More specifically, this sought after and longstanding species occurs from Colombia and northern to southern Brazil. Within this range, these tarantulas may be found in tropical rainforests to other tropical forests and woodlands, where they occupy self-excavated burrows, burrows constructed by other animals, and underneath vegetation, rocks, logs, and other ground debris.

Conservation Status

Not Evaluated for the IUCN Red List (NE) or otherwise Data Deficient (DD).

Legal and Regulatory Status (*Subject to Change)

Consult with your local, municipal, and state ordinances and regulations for any ownership restrictions.

Experience Level Required

Intermediate/Moderate to Advanced.

Size

Colombian giant tarantulas are large tarantulas reaching a total legspan of about 6 ½ to 8 inches on average.

Housing and Enclosure

Provide a sturdy, secure, and escape proof terrarium or enclosure 10 to 15 gallons long in size with a secure top for a single adult spider. Several of the acrylic displays and enclosures that are now manufactured for housing arachnids, insects, and other invertebrates can also be used. Spiderlings can be housed in an appropriately sized spiderling vial, plastic container or deli cup with adequate holes for ventilation. Acceptable substrate to use can include pesticide free potting soil, coconut fiber, vermiculite, or similar substrates 6 to 8 inches in depth. Decorations and/or other cage furnishings can also be included as well, although floor space is more important than height. This is a primarily terrestrial to burrowing species, but benefits from branches, horizontal cork bark, and plants for refuge. A fairly small, shallow water dish can also be provided, and should be cleaned regularly as well as regular misting for hydration.

Temperature, Lighting, and Humidity

Most species of tarantulas have simple and undemanding heating and lighting requirements in captivity, and do not require additional UVA/UVB lighting, although providing it can be greatly beneficial for your tarantula's health, immune system, and overall wellness. Colombian giant tarantulas are a hardy species that do best at room temperature between 75 to 80 degrees. Maintain at 70 to 80 % humidity. For any supplemental heating that may be needed, use a low wattage incandescent or UVA/UVB bulb, radiant or ceramic heat emitter, or UTH (under tank heating element). More specific lighting, heating, and humidity product suggestions and recommendations that can best suit one's needs, as well as those of one's animals can be given as well.

Feeding, Diet, and Nutrition

Insectivorous to Carnivorous; In the wild, Colombian giant tarantulas are primarily insectivorous, meaning they eat insects and other invertebrates. They will also occasionally eat smaller vertebrates as well if they can catch and subdue them. In captivity, these tarantulas can be fed a variety of appropriately sized feeder insects such as crickets, roaches, mealworms,

<http://www.madisonherps.org>

superworms, and waxworms. Feeder insects should be gut-loaded in order to increase their optimal nutritional value. This will promote optimal exoskeleton growth and development. Any uneaten food items should be cleaned and removed after a day or two. Their feeding frequency will depend on the age, size, and overall health of your animal. Use care as to not overfeed even invertebrates, as obesity and other health related issues can still become an issue with them. More specific dietary and supplementary product suggestions and recommendations that can best suit one's needs, as well as those of one's animals can be given as well.

Handling

Colombian giant tarantulas are typically a defensive and nervous, albeit slow moving species, and any handling of this species should be done so carefully so as to avoid injuring the spider. Tarantulas are fragile animals, and accidentally dropping a spider can result in the rupture of its internal organs and/or exoskeleton, causing death to your tarantula. Colombian giant tarantulas may also kick urticating hairs from its abdomen and hind legs or "rear up" to display its fangs and front legs when upset or agitated. Although most tarantulas are not medically significant, with most being lesser than or just about equal to a bee sting, medical attention should still be sought from any apparent allergic reaction to a bite, or extreme irritation from urticating hairs from a pet tarantula.

Also be sure to practice basic cleanliness and hygiene associated with proper husbandry after touching or handling any animals or animal enclosures to prevent the possibility of contracting salmonellosis or any other zoonotic pathogens
