## Mexican Fireleg Tarantula (*Brachypelma boehmei*)

---

### **Vibrant Colored Legs and Joints on Fire!**

Mexican firelegs are a terrestrial, semi burrowing species that tends to be solitary and nocturnal, as with most other tarantulas. This is a medium sized to fairly large species, named for its vibrant reddish to reddish orange carapace and legs, and darker abdomen. A somewhat skittish but hardy species, the Mexican fireleg can make for attractive and choice for a pet tarantula for the beginning to intermediate enthusiast.

### **Taxonomy**

**Life:** All living, physical, and animate entities

**Domain:** Eukaryota

**Kingdom:** Animalia

**Phylum:** Arthropoda

**Subphylum:** Chelicerata

**Class:** Arachnida

**Order:** Araneae

**Infraorder:** Mygalomorphae

**Family:** Theraphosidae

**Genus:** *Brachypelma*

**Species:** *Brachypelma boehmei*\*

*\*Taxonomy subject to change and revision.*

### **Lifespan and Longevity**

Males of many tarantula species will often attain life spans of only 5 to 6 years. Females attain considerably longer life spans of 15 to 20 years or more in captivity.

### **Distribution and Habitat**

The Mexican fireleg tarantula is a medium sized to large, vibrantly colored species indigenous to the grasslands, savannah, and scrublands of Mexico in Central America.

### **Conservation Status**

Not Evaluated for the IUCN Red List (NE) or otherwise Data Deficient (DD).

### **Experience Level Required**

Novice/Beginner to Intermediate/Moderate.

<http://www.madisonherps.org>

### **Size**

Mexican fireleg tarantulas are medium-sized to large tarantulas reaching a total legspan of about 5 ½ to 6 ½ inches on average.

### **Housing and Enclosure**

Provide a sturdy, secure, and escape proof terrarium or enclosure 5 to 10 gallons long in size with a secure top for a single adult spider. Several of the acrylic displays and enclosures that are now manufactured for housing arachnids, insects, and other invertebrates can also be used. Spiderlings can be housed in an appropriately sized spiderling vial, plastic container or deli cup with adequate holes for ventilation. Acceptable substrate to use can include pesticide free potting soil, coconut fiber, vermiculite, or similar substrates 3 to 4 inches in depth. Decorations and/or other cage furnishings can also be included as well, although floor space is more important than height. This is a primarily terrestrial to burrowing species, but benefits from branches, horizontal cork bark, and plants for refuge. A fairly small, shallow water dish can also be provided, and should be cleaned regularly as well as regular misting for hydration.

### **Temperature, Lighting, and Humidity**

Most species of tarantulas have simple and undemanding heating and lighting requirements in captivity, and do not require additional UVA/UVB lighting, although providing it can be greatly beneficial for your tarantula's health, immune system, and overall wellness. Mexican fireleg tarantulas are species that can be maintained at room temperature between 70 to 85 degrees. Maintain at around 70 to 80% humidity. This species prefers somewhat moister conditions than many other *Brachypelma* species. For any supplemental heating that may be needed, use a low wattage incandescent or UVA/UVB bulb, radiant or ceramic heat emitter, or UTH (under tank heating element). More specific lighting, heating, and humidity product suggestions and recommendations that can best suit one's needs, as well as those of one's animals can be given as well.

### **Feeding, Diet, and Nutrition**

***Insectivorous to Carnivorous;*** In the wild, Mexican fire-leg tarantulas are primarily insectivorous, meaning they eat insects and other invertebrates. They will also occasionally eat smaller vertebrates as well if they can catch and subdue them. In captivity, these tarantulas can be fed a variety of appropriately sized feeder insects such as crickets, roaches, mealworms, superworms, and waxworms. Feeder insects should be gut-loaded in order to increase their optimal nutritional value. This will promote optimal exoskeleton growth and development. Any uneaten food items should be cleaned and removed after a day or two. Their feeding frequency will depend on the age, size, and overall health of your animal. Use care as to not overfeed even invertebrates, as obesity and other health related issues can still become an issue with them. More specific dietary and supplementary product suggestions and recommendations that can best suit one's needs, as well as those of one's animals can be given as well.

### **Handling**

Mexican fireleg tarantulas are often said to be a skittish species, prone to kick up urticating hairs when approached or disturbed. Tarantulas in general are fragile animals, and accidentally dropping a spider can result in the rupture of its internal organs and/or exoskeleton, causing death to your tarantula. Although most tarantulas are not medically significant, with most being lesser than or just about equal to a bee sting, medical attention should still be sought from any apparent allergic reaction to a bite, or extreme irritation from urticating hairs from a pet tarantula.
