Costa Rican Red Rump Tarantula (*Brachypelma/Sericopelma angustum*)

Mexican Red Rump Tarantula (*Brachypelma/Sericopelma vagans*)

Abdomens of Red and Orange

The Costa Rican and Mexican red rump tarantulas are medium sized to large tarantulas with a dark glossy blackish to bluish-black carapace and legs, with reddish, orangish, to reddish-brown to blackish hairs on the abdomen and legs depending on the species, hence their common names. Mexican and Costa Rican red rumps are a terrestrial, semi burrowing species that tends to be solitary and nocturnal, as with most other tarantulas. A docile and hardy species, the red rump species can make for attractive and docile choice for a pet tarantula for the beginning to intermediate enthusiast.

Taxonomy

Life: All living, physical, and animate entities

Domain: Eukaryota

Kingdom: Animalia

Phylum: Arthropoda

Subphylum: Chelicerata

Class: Arachnida

Order: Araneae

Infraorder: Mygalomorphae

Family: Theraphosidae

Genus: *Brachypelma*

Species: *Brachypelma vagans** and *Brachypelma angustum**

*Taxonomy subject to change and revision.

Lifespan and Longevity

Males of many tarantula species will often attain life spans of only 5 to 6 years. Females attain considerably longer life spans of 15 to 20 years or more in captivity.

Distribution and Habitat

Collectively, the Costa Rican and Mexican red rump tarantulas are indigenous to the savannah,

<http://www.madisonherps.org>

scrubland, and grasslands of Mexico and Costa Rica in Central America.

Conservation Status

Not Evaluated for the IUCN Red List (NE) or otherwise Data Deficient (DD).

Experience Level Required

Novice/Beginner to Intermediate/Moderate.

Size

Red rump tarantulas are medium-sized to large tarantulas reaching a total legspan of about 5 to 6 ½ inches on average.

Housing and Enclosure

Provide a sturdy, secure, and escape proof terrarium or enclosure 5 to 10 gallons long in size with a secure top for a single adult spider. Several of the acrylic displays and enclosures that are now manufactured for housing arachnids, insects, and other invertebrates can also be used. Spiderlings can be housed in an appropriately sized spiderling vial, plastic container or deli cup with adequate holes for ventilation. Acceptable substrate to use can include pesticide free potting soil, coconut fiber, vermiculite, or similar substrates 3 to 4 inches in depth. Decorations and/or other cage furnishings can also be included as well, although floor space is more important than height. This is a primarily terrestrial to burrowing species, but benefits from branches, horizontal cork bark, and plants for refuge. A fairly small, shallow water dish can also be provided, and should be cleaned regularly as well as regular misting for hydration.

Temperature, Lighting, and Humidity

Most species of tarantulas have simple and undemanding heating and lighting requirements in captivity, and do not require additional UVA/UVB lighting, although providing it can be greatly beneficial for your tarantula's health, immune system, and overall wellness. Red rump tarantulas are species that can be maintained at room temperature between 70 to 85 degrees. Maintain at around 65 to 70% humidity. For any supplemental heating that may be needed, use a low wattage incandescent or UVA/UVB bulb, radiant or ceramic heat emitter, or UTH (under tank heating element). More specific lighting, heating, and humidity product suggestions and recommendations that can best suit one's needs, as well as those of one's animals can be given as well.

Feeding, Diet, and Nutrition

Insectivorous to Carnivorous; In the wild, red rump tarantulas are primarily insectivorous, meaning they eat insects and other invertebrates. They will also occasionally eat smaller vertebrates as well if they can catch and subdue them. In captivity, these tarantulas can be fed a variety of appropriately sized feeder insects such as crickets, roaches, mealworms, superworms, and waxworms. Feeder insects should be gut-loaded in order to increase their optimal nutritional value. This will promote optimal exoskeleton growth and development. Any uneaten food items should be cleaned and removed after a day or two. Their feeding frequency will depend on the age, size, and overall health of your animal. Use care as to not overfeed even invertebrates, as obesity and other health related issues can still become an issue with them. More specific dietary and supplementary product suggestions and recommendations that can best suit one's needs, as well as those of one's animals can be given as well.

Handling

<http://www.madisonherps.org>

Red rumps are typically a docile and mild mannered species that seldom kick up urticating hairs or assume defensive postures, although some may be somewhat skittish. Tarantulas in general are fragile animals, and accidentally dropping a spider can result in the rupture of its internal organs and/or exoskeleton, causing death to your tarantula. Although most tarantulas are not medically significant, with most being lesser than or just about equal to a bee sting, medical attention should still be sought from any apparent allergic reaction to a bite, or extreme irritation from urticating hairs from a pet tarantula.

Also be sure to practice basic cleanliness and hygiene associated with proper husbandry after touching or handling any animals or animal enclosures to prevent the possibility of contracting salmonellosis or any other zoonotic pathogens

Contact
